Website used: yahoo mail on a browser

1. Three design patterns
   a. Button groups
      i.
      ii. Good for quick and easy access to other categories in yahoo landing page
   b. Two Panel selector or possibly cascading lists

      i.
      ii. On the left side, you can select the categories which would display its children and content on the right pane. So you can see how your emails are categorized with ease and only look at emails you want in that category. Like in inbox you wont see spam email.
   c. New-Item row

      i.
      ii. Uses the last row of the categories list/ first row in the folders category, to add a new item/folder. Helps the user create custom folders to organize their email in. such as work folder, school folder etc.
2. Drawn
3.
   a. Two pane selector for the emails, so that you can see the full content of the email in a pane beside selecting the email pane. so it helps so the list were selecting emails from , doesn't disappear and we can look through content for a lot emails quickly. Without the need of doing more repetitive actions needed.
      i. Because in the normal yahoo mail, when you click on an email it replaces the whole list with the content using a single pane. and you go back to selecting emails, it resets and jumps back all the way to the top.
   b. Autocompletion for sorting and finding most relevant emails in the search bar pop up, to allow users to just select emails that match based on autocompletion of possible emails.
      i. Because yahoo email search bar doesn't allow that.
